

Maruthi Household Services

MAD-2 Household Services Application V2 Project Report

Author:

Name: Akula Geetha Maheswari

Roll No: 21f3000254

Email: 21f3000254@ds.study.iitm.ac.in

Date of Submission: 03rd December 2024

Project Details:

Problem Statement: Develop a web app for connecting customers with service professionals for household services and an admin for managing the application for providing best experience to customers.

Description:

Maruthi Household Services is a multi-user application with one admin, service professionals and customers which acts as a platform for providing comprehensive home services.

Admin: Manages services, monitors users, flags/unflags, approves/rejects professionals and track requests.

Customers: Can send service requests, track them, and close the request after completion, and rate the service.

Professional: Accepts/rejects service requests and tracks assigned requests.

Frameworks and Libraries Used:

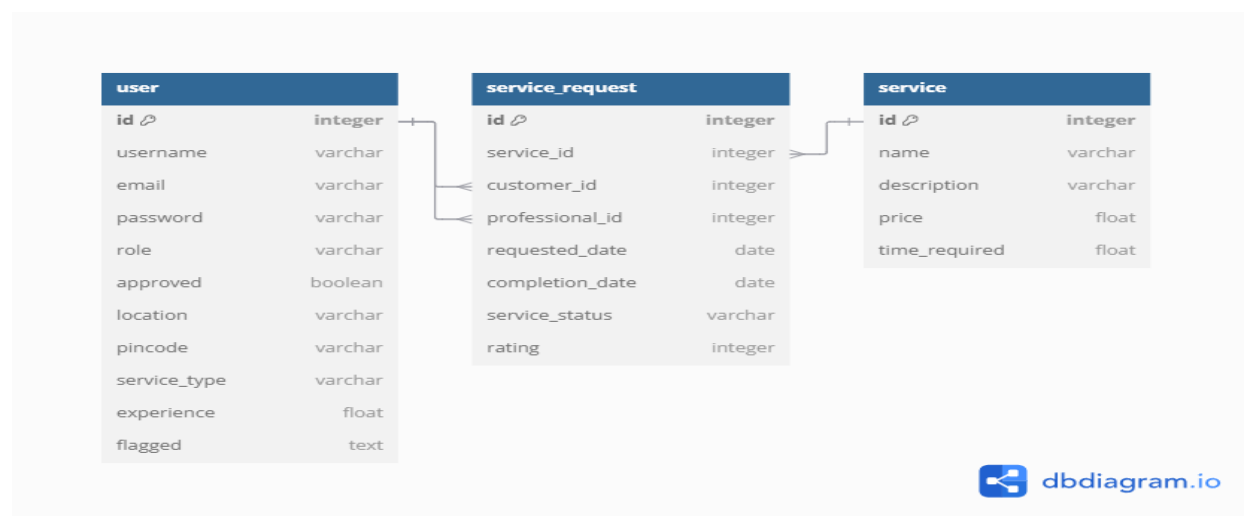

SQLite	-	Lightweight database used for data storage
Flask	-	Python framework used to build application backend
VueJS with CLI	-	Javascript framework for UI design
CSS	-	For styling
Flask-RESTful	-	API's for frontend and backend interactions
Flask-SQLAlchemy	-	ORM for database interactions
Flask-JWT-Extended	-	For Token based authentication

API Resource Endpoints:

Base URL: <http://127.0.0.1:5000> , **Prefix:** /api

- **Authentication:** POST /register, POST /login, POST /logout
- **Services:** GET/POST/PUT/DELETE /service, GET /service/id
- **Service Requests:** GET /service_request/id, GET /service_requests, POST /service_request/create,
DELETE /service_request/id/cancel, POST /service_request/id/accept,
DELETE /service_request/id/reject, PUT /service_request/id/close
- **User:** GET /users, GET /user/id, GET /user/id/orders, PUT /user/feedback
- **Professional:** GET/POST /pending_professionals, GET /professionals, GET /professional/id/rating,
PUT /professional/id/flagging, GET /service/id/professionals,
GET /professional/id/requests, GET /professional/id/orders
- **Stats:** GET /stats

ER Diagram of the Database:

DB Models: User, Service, ServiceRequest

One to many Relationships: User, ServiceRequest
Service, ServiceRequest
